                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -!- PATHWAY: Arginine biosynthesis, sixth step.
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the ATCase/OTCase family.
-!- CAUTION: Lacks the conserved threonine residue in position 48, which is part of the carbamoylphosphate binding site; it is replaced by a leucine residue.
                                                                                                                                                                                                                                                                                                                                                                             .

Natl. Acad. Sci. U.S., 90:8856-8860(1993).

-!- FINCTION: Receptor for MSH (alpha, beta and gamma) and ACTH.
-!- SUBCELLUIAR LOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rattus norvegicus (Rat).

"Molecular cloning, characterization, and nucleotide sequence of
tagatose 6-phosphate pathway gene cluster of the lactose operon o

    J. Biol. Chem. 266:7176-7181(1991).
    -!- CATALYTIC ACTIVITY: D-tagatose 1,6-bisphosphate = glycerone phosphate + D-glycertaldehyde 3-phosphate.
    -!- PATHWAY: Tagatose 6-phosphate pathway of lactose catabolism.
    -!- SIMILARITY: Belongs to the aldolase lacD family.

                                                                                                                                                                                                                                                                                                                                                                                                                  .

J. Bacteriol. 183:5709-5717(2001).
-I- CATALYMIC ACTIVITY: D-tagatose 1,6-bisphosphate = glycerone phosphate + D-glyceraldehyde 3-phosphate.
-I- PATHWAY: Tagatose 6-phosphate pathway of lactose catabolism.
-I- SIMILARITY: Belongs to the aldolase lacD family.
                             .

"SpFrx-1, a sea urchin homeobox gene related to aristaless is expressed during embryogenesis.";
Submitted (MAY-1996) to the BMEL/GenBank/DDBJ databases.
-I- SUBCELLULAR LOCATION: Nuclear (By similarity).
-I- SIMILARITY: Belongs to the paired homeobox family. Bicoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  icore 6; DB 1; Length 220,

SUBUNIT: Homodimer. The RNAP catalytic core consists of 2 alpha, 1 beta, 1 beta' and 1 omega subunit (By similarity).
DOMAIN: The N-terminal domain is essential for RNAP assembly and basal transcription, whereas the C-terminal domain is involved in interaction with transcriptional regulators and with upstream

gene family from Kluyveromyces marxianus - polymerase chain
reaction-single-strand conformation polymorphism as a tool for the
study of multigenic families.";
Yeast 11:725-733 (1955).
-!- CATALYIC ACTIVITY: D-glyceraldehyde 3-phosphate + phosphate +
NAD(+) = 3-phospho-D-glyceroyl phosphate + NADH.
-!- PATHWAY: Second phase of glycolysis; first step.
-!- SUBUNIT: Homotetramer (By similarity).
-!- SUBUNITY: Belongs to the glyceraldehyde 3-phosphate.
                        28-FEB-2003 (Rel. 41, Last annotation update)
Glyceraldehyde 3-phosphate dehydrogenase 2 (EC 1.2.1.12) (GAPDH 2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Spirochaetes; Spirochaetales; Spirochaetaceae; Treponema.

= s(8)-2-hydroxy-2-methyl-3-oxobutanoate + NADPH.
= r(9)-2-hydroxy-2-methyl-3-oxobutanoate + NADPH.
= r(9)-2-hydroxy-2-methyl-3-oxobutanoate + NADPH.
-i- PATHWAY: Valine and isoleucine biosynthesis; second step.
-i- SIMILARITY: Belongs to the ketol-acid reductoisomerase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi;

Molecular cloning and characterization of rat ficolin-A.";
Submitted (APR-1999) to the EMBL/GenBank/DDBJ databases.
-- FUNCTION: Involved in serum exerting lectin activity. Binds GloNAc-
--- SUBGNIT: HOMOPOLYMER. INTERACTS WITH ELASTIN (BY SIMILARITY).
--- SUBGNIT: HOMOPOLYMER. INTERACTS FOUND ON THE MONOCYTE SURFACE (BY SIMILARITY: Belongs to the ficolin lectin family.
--- SIMILARITY: Contains 1 collagenous domain.
--- SIMILARITY: Contains 1 fibrinogen C-terminal domain.
                                                                                                                                                                                                                                                                                                                                                                                                                     16-007-2001 (Rel. 40, Last sequence update)
16-007-2001 (Rel. 40, Last annotation update)
Ficolin 1 precursor (Collagen/fibrinogen domain-containing protein 1)
(Ficolin-A) (Ficolin A) (M-Ficolin).
                                                                                                                                                                                                                                                                           Gaps

"Transaldolase deficiency: liver cirrhosis associated with a new
inborn error in the pentose phosphate pathway.";
Am. J. Hum. Genet. 68:1086-1082 (2201).
-I- FUNCTION: Transaldolase is important for the balance of
metabolites in the pentose-phosphate pathway.
-I- CATALYTIC ACTIVITY: Sedohaptulose 7-phosphate + D-glyceraldehyde
3-phosphate = D-erythrose 4-phosphate + D-fructose 6-phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                               -I- PATHWAY: Pentose phosphate pathway; nonoxidative part.
-I- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-I- DISEASE Defects in TALDOI are a cause of a deficiency that results in telangiectases of the skin, hepatosplenomegaly, and enlarged clitoris.
                                                                                                                                                                                                                                                                                                                                                                                               -!- SIMILARITY: Belongs to the transaldolase family. Subfamily 1.

-- FUNCTION: Transaldolase is important for the balance of metabolites in the pentose-phosphate pathway (By similarity).

-- C. - CATALYTIC ACTIVITY: Sedoheptulose 7-phosphate + D-glyceraldehyde

C. - CATALYTIC ACTIVITY: Belongs to the transaldolase family. Subfamily 1.

-- SUBCELLUAR LOCATION: Cytoplasmic (Probable).
                                                                                                                                                                                                                                                                                                      'Cloning and chromosomal localization of a paralog and a mouse homolog
